# 1 Introduction

Title drafting:

- Performing the Analytic Hierarchy Process with survey data from `\emph{SoSci Survey}` and R-package `\emph{ahpsurvey}`
- Auswertung der Umfragedaten aus `\emph{SoSci Survey}` zum Thema `\emph{Essbare Städte}` mit Hilfe des Analytic Hierarchy Process (AHP) und dem R-Paket `\emph{ahpsurvey}`
- Analysis of survey data from `\emph{SoSci Survey}` in the `\emph{Edible Cities}` project using the Analytic Hierarchy Process (AHP) and the R-package `\emph{ahpsurvey}`

Why we use a [Jupyter](#) notebook to to publish the R program examples:

Jupyter is a new **open source** alternative to the proprietary numerical software [Mathematica](#) from **Wolfram Research** that is well on the way to become a **standard for exchanging research results** (Somers 2018; Romer 2018).

Originally Jupyter was intended as an IDE for the programming languages **Julia** and **Python**. Besides that it is also possible to install other interpreter kernels, such as the [IRkernel](#) for R. This can be interesting if the IDE **RStudio Desktop** is not available on the target platform used. For example, it is very difficult to install RStudio on the ARM-based embedded computer **Raspberry Pi** due to many technical dependencies. In contrast, using the R kernel in JupyterLab on the Raspberry Pi works very well and performant.

## 2 Global loading of the used R packages and definition of globally used functions

### 2.1 Install missing packages if not present yet

**Attention:** For some R packages several dependencies have to be installed first with `apt install <package name>`.

Dependencies for package `ahpsurvey`:

- R package `randomNames` (it depends on R 4.0, refer to <https://cran.r-project.org/web/packages/randomNames/index.html>)

Drawback for **Raspbian buster**: the dependency `randomNames` is not available for R v3.5.2 as it depends on R ( 4.0). Upgrading R in Raspbian following the instruction on <https://cran.rstudio.com/bin/linux/debian/#debian-buster-stable> does not work so far ...

```
[1]: # List of R packages that are used in this script
list.of.packages <- c("data.table", "ggplot2", "tidyr", "dplyr", "magrittr",
  ↪ "ahpsurvey", "knitr", "IRdisplay", "forcats")

# Query the already installed packages and save the missing ones in a new list
missing.packages <- list.of.packages[!(list.of.packages %in% installed.
  ↪ packages()[, "Package"])]

# Install missing packages
if(length(missing.packages)) {
  install.packages(missing.packages)
} else {
  print("All required packages are installed.")
}
```

```
[1] "All required packages are installed."
```

### 2.2 Load package `data.table`

The package `data.table` is used to read and manipulate tables (`data.table` inherits from `data.frame`).

```
[2]: library(data.table)
```

### 2.3 Load package ggplot2

The package `ggplot2` is used to plot diagrams.

```
[3]: library(ggplot2)
```

### 2.4 Load packages knitr and IRdisplay

The `kable()` function from the package `knitr` is used to output dataframes as a markdown tables.

The `display_markdown()` function from the package `IRdisplay` renders the markdown table in the notebook as well as in the PDF version.

```
[4]: library(knitr)
      library(IRdisplay)
```

### 2.5 Load package tidyr

The package `tidyr` is used to **reshape** the dataframes and provides functions like `gather()` or `spread()`. Some examples for the application can be found here: [Reshaping Your Data with tidyr](#).

```
[5]: library(tidyr)
```

### 2.6 Load package dplyr

The package `dplyr` is necessary to manipulate dataframes using functions like `select()`, `mutate()` and `left_join()`.

**Hint:** Setting the parameter `warn.conflicts=FALSE` when calling the `library()` function silences annoying messages about masked functions.

```
[6]: library(dplyr, warn.conflicts=FALSE)
```

### 2.7 Use pipes for better coding

The package `magrittr` provides the pipe functionality and can be used to create more effective code for processing large datasets. What pipes of the form like `%>%` are and how to use them is described here: <https://statistik-dresden.de/archives/15679>.

**HINT:** The pipe functionality is already available by loading the library `tidyr` - so you don't have to load it explicitly.

Before pipes can be used in R, the package `magrittr` has to be loaded first:

```
[7]: library(magrittr, warn.conflicts=FALSE)
```

### 2.8 Load package forcats

The `fct_inorder()` function from the package `forcats` is used to reorder the discrete levels of diagram axes according to the intended order of attributes.

```
[8]: library(forcats)
```

## 2.9 Load package ahpsurvey

The package `ahpsurvey` contains all the necessary mathematical and statistical methods to run the analytical hierarchy process (AHP).

```
[9]: library(ahpsurvey)
```

## 2.10 Function to format dataframes as markdown tables

Following function formats given dataframes as markdown tables using the `kable()` function from the `knitr` package.

The `display_markdown()` function from the package `IRdisplay` renders the markdown table in the Jupyter notebook as well as in the compiled PDF version.

```
[10]: func_render_md_tables <- function(df_table, str_table_header) {  
  # format the dataframe as a markdown table using the 'kable()' function from  
  # the 'knitr' package  
  table_out <- kable(  
    df_table,  
    format = "markdown",  
    # digits = 2,  
    caption = str_table_header)  
  
  display_markdown(as.character(table_out))  
}
```

# 3 Prepare raw CSV input data from ScoSciSurvey for analytical hierarchy process (AHP)

## 3.1 Set globally used input and output folders for preparing raw CSV data

```
[11]: str_input_path_prep = "./input_data_from_survey"  
str_output_path_prep = "./output_data_manipulated"
```

## 3.2 Define functions to prepare the survey data for further analysis

The following functions are used to read the survey data from the CSV files and prepare the data structure for further analysis with the R package `ahpsurvey`.

### 3.2.1 Function to read the survey data from CSV files to dataframe objects

Define a function for reading in a CSV file to 4 different dataframes by selecting different columns.

```
[12]: func_readCSVdata_to_dataframes <- function(str_CSVfilename) {  
  
  # criteria (main criteria)  
  df_mySurvey_1 <- fread(  
    file = str_CSVfilename, encoding = "UTF-8",  
    header = TRUE, sep = "\t", quote = "\"",  
    # dec = ".", row.var = "CASE",  
    select = c("CASE", "AK01", "AK02", "AK03",  
               "RK01_01", "RK02_01", "RK03_01", "RK04_01", "RK05_01", "RK06_01")  
  )  
}
```

```

# environmental sub-criteria
df_mySurvey_2 <- fread(
  file = str_CSVfilename, encoding = "UTF-8",
  header = TRUE, sep = "\t", quote = "\"",
  # dec = ".", row.names = "CASE",
  select = c("CASE", "AU01", "AU02", "AU03",
             "RU01_01", "RU02_01", "RU03_01", "RU04_01", "RU05_01", "RU06_01")
)

# social sub-criteria
df_mySurvey_3 <- fread(
  file = str_CSVfilename, encoding = "UTF-8",
  header = TRUE, sep = "\t", quote = "\"",
  # dec = ".", row.names = "CASE",
  select = c("CASE", "AS01", "AS02", "AS03",
             "RS01_01", "RS02_01", "RS03_01", "RS04_01", "RS05_01", "RS06_01")
)

# economic sub-criteria
df_mySurvey_4 <- fread(
  file = str_CSVfilename, encoding = "UTF-8",
  header = TRUE, sep = "\t", quote = "\"",
  # dec = ".", row.names = "CASE",
  select = c("CASE", "AW01", "AW02", "AW03",
             "RW01_01", "RW02_01", "RW03_01", "RW04_01", "RW05_01", "RW06_01")
)

output <- list(df_mySurvey_1, df_mySurvey_2, df_mySurvey_3, df_mySurvey_4)

return(output)
}

```

### 3.2.2 Function to prepare the data and store it in new dataframes

```

[13]: func_scrambleData <- function(df_inputData, vec_colnames_search_1,
  ↪vec_colnames_search_2, vec_colnames_out) {
  # Generate new dataframe ...
  df_outputData <- data.frame(matrix(ncol = 3, nrow = 0))
  # ... and name the columns
  colnames(df_outputData) <- vec_colnames_out

  # Generate 1. column
  for ( row_idx in 1:nrow(df_inputData) ) {
    # filter column names by vector element
    if (df_inputData[row_idx, colnames(df_inputData) %in% vec_colnames_search_1[1],
  ↪with=FALSE] == 1) {
      int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
  ↪vec_colnames_search_2[1], with=FALSE])
      int_tmp_val <- int_tmp_val * -1 - 1

      df_outputData[row_idx, vec_colnames_out[1]] <- int_tmp_val
    }
    else if (df_inputData[row_idx, colnames(df_inputData) %in%
  ↪vec_colnames_search_1[1], with=FALSE] == -1) {
      df_outputData[row_idx, vec_colnames_out[1]] <- 1
    }
  }
}

```

```

    else if (df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_1[1], with=FALSE] == 2) {
        int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_2[2], with=FALSE])
        int_tmp_val <- int_tmp_val + 1

        df_outputData[row_idx, vec_colnames_out[1]] <- int_tmp_val
    }
}

# Generate 2. column
for ( row_idx in 1:nrow(df_inputData) ) {
    # filter column names by vector element
    if (df_inputData[row_idx, colnames(df_inputData) %in% vec_colnames_search_1[2],
↪with=FALSE] == 1) {
        int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_2[3], with=FALSE])
        int_tmp_val <- int_tmp_val * -1 - 1

        df_outputData[row_idx, vec_colnames_out[2]] <- int_tmp_val
    }
    else if (df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_1[2], with=FALSE] == -1) {
        df_outputData[row_idx, vec_colnames_out[2]] <- 1
    }
    else if (df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_1[2], with=FALSE] == 2) {
        int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_2[4], with=FALSE])
        int_tmp_val <- int_tmp_val + 1

        df_outputData[row_idx, vec_colnames_out[2]] <- int_tmp_val
    }
}

# Generate 3. column
for ( row_idx in 1:nrow(df_inputData) ) {
    # filter column names by vector element
    if (df_inputData[row_idx, colnames(df_inputData) %in% vec_colnames_search_1[3],
↪with=FALSE] == 1) {
        int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_2[5], with=FALSE])
        int_tmp_val <- int_tmp_val * -1 - 1

        df_outputData[row_idx, vec_colnames_out[3]] <- int_tmp_val
    }
    else if (df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_1[3], with=FALSE] == -1) {
        df_outputData[row_idx, vec_colnames_out[3]] <- 1
    }
    else if (df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_1[3], with=FALSE] == 2) {
        int_tmp_val <- as.integer(df_inputData[row_idx, colnames(df_inputData) %in%
↪vec_colnames_search_2[6], with=FALSE])
        int_tmp_val <- int_tmp_val + 1

```

```

    df_outputData[row_idx, vec_colnames_out[3]] <- int_tmp_val
  }
}

# return scrambled dataframe
return(df_outputData)
}

```

### 3.2.3 Function to write resulting dataframes to CSV files

```

[14]: func_writeDataframe_to_CSVfile <- function(str_path, str_CSVfilename, df_dataframe,
↳str_filenameExtension) {
  # Split file name on second underscore, found here:
  # https://stackoverflow.com/questions/32398427/
  ↳r-split-a-character-string-on-the-second-underscore/32398489#32398489
  list_str_split <- strsplit(sub('^([_]+)[^_+](.*)$', '\\1 \\2',
↳str_CSVfilename), ' ')

  # extend the file name prefix and glue together with old suffix
  str_CSVfilename_extended <- paste(list_str_split[[1]][1], str_filenameExtension,
↳list_str_split[[1]][2], sep="_")

  # extend file name by path
  str_CSVfilename_extended <- paste(str_path, str_CSVfilename_extended, sep="/")

  write.table(df_dataframe, file = str_CSVfilename_extended,
    fileEncoding = "UTF-8", row.names = FALSE,
    col.names = TRUE, sep = "\t", quote = TRUE)
}

```

## 3.3 Create dataframe (table) handling the file names of input CSV data (raw data from survey)

```

[15]: df_csvInputFiles <- data.table(
  file_idx = 1:4,
  keys = c("all", "CA", "NGO", "PE"),
  filenames = c("rdata_all_AHP_edible_Cities_2022-03-18_09-53.csv",
    "rdata_CA_AHP_edible_Cities_2022-03-18_10-28.csv",
    "rdata_NGO_AHP_edible_Cities_2022-03-18_10-40.csv",
    "rdata_PE_AHP_edible_Cities_2022-03-18_10-41.csv"),
  descriptions = c("all target groups together",
    "City Administrations",
    "Non-Governmental Organisations",
    "Practitioners and Experts")
)

func_render_md_tables(df_csvInputFiles, "File table for handling the file names of
↳input CSV data (raw data from survey)")

```

Table 1: File table for handling the file names of input CSV data (raw data from survey)

file_idx	keys	filenames	descriptions
1	all	rdata_all_AHP_edible_Cities_2022-03-18_09-53.csv	all target groups together

file_idx	keys	filenames	descriptions
2	CA	rdata_CA_AHP_edible_Cities_2022-03-18_10-28.csv	City Administrations
3	NGO	rdata_NGO_AHP_edible_Cities_2022-03-18_10-40.csv	Non-Governmental Organisations
4	PE	rdata_PE_AHP_edible_Cities_2022-03-18_10-41.csv	Practitioners and Experts

### 3.4 Prepare the data and store it in new CSV files for each criterion

#### 3.4.1 Criteria (main criteria)

Walk over all input CSV files, select necessary columns, filter cells by given algorithm, and write the results to output CSV files:

```
[16]: vec_colnames_search_1 <- c('AK01', 'AK02', 'AK03')
vec_colnames_search_2 <- c('RK01_01', 'RK02_01', 'RK03_01', 'RK04_01', 'RK05_01',
  ↪ 'RK06_01')
vec_colnames_out <- c('Envi_Soci', 'Envi_Econ', 'Soci_Econ')

for ( row_idx in 1:nrow(df_csvInputFiles) ) {
  # create list of dataframes from current input CSV file
  str_filename <- paste(str_input_path_prep, df_csvInputFiles[row_idx, filenames],
  ↪ sep="/")
  list_dataframes <- func_readCSVdata_to_dataframes(str_filename)

  # scramble the dataframes
  df_scrambledData <- func_scrambleData(list_dataframes[[1]],
  ↪ vec_colnames_search_1, vec_colnames_search_2, vec_colnames_out)

  # write scrambled dataframes to output CSV file
  func_writeDataframe_to_CSVfile(str_output_path_prep, df_csvInputFiles[row_idx,
  ↪ filenames], df_scrambledData, "crit")
}
```

#### 3.4.2 Environmental sub-criteria

Walk over all input CSV files, select necessary columns, filter cells by given algorithm, and write the results to output CSV files:

```
[17]: vec_colnames_search_1 <- c('AU01', 'AU02', 'AU03')
vec_colnames_search_2 <- c('RU01_01', 'RU02_01', 'RU03_01', 'RU04_01', 'RU05_01',
  ↪ 'RU06_01')
vec_colnames_out <- c('Clim_BDiv', 'Clim_CiEc', 'BDiv_CiEc')

for ( row_idx in 1:nrow(df_csvInputFiles) ) {
  # create list of dataframes from current input CSV file
  str_filename <- paste(str_input_path_prep, df_csvInputFiles[row_idx, filenames],
  ↪ sep="/")
  list_dataframes <- func_readCSVdata_to_dataframes(str_filename)

  # scramble the dataframes
  df_scrambledData <- func_scrambleData(list_dataframes[[2]],
  ↪ vec_colnames_search_1, vec_colnames_search_2, vec_colnames_out)

  # write scrambled dataframes to output CSV file
```

```
func_writeDataframe_to_CSVfile(str_output_path_prep, df_csvInputFiles[row_idx,
↪filenames], df_scrambledData, "env")
}
```

### 3.4.3 Social sub-criteria

Walk over all input CSV files, select necessary columns, filter cells by given algorithm, and write the results to output CSV files:

```
[18]: vec_colnames_search_1 <- c('AS01', 'AS02', 'AS03')
vec_colnames_search_2 <- c('RS01_01', 'RS02_01', 'RS03_01', 'RS04_01', 'RS05_01',
↪'RS06_01')
vec_colnames_out <- c('KEdu_Comm', 'KEdu_Part', 'Comm_Part')

for ( row_idx in 1:nrow(df_csvInputFiles) ) {
  # create list of dataframes from current input CSV file
  str_filename <- paste(str_input_path_prep, df_csvInputFiles[row_idx, filenames],
↪sep="/")
  list_dataframes <- func_readCSVdata_to_dataframes(str_filename)

  # scramble the dataframes
  df_scrambledData <- func_scrambleData(list_dataframes[[3]],
↪vec_colnames_search_1, vec_colnames_search_2, vec_colnames_out)

  # write scrambled dataframes to output CSV file
  func_writeDataframe_to_CSVfile(str_output_path_prep, df_csvInputFiles[row_idx,
↪filenames], df_scrambledData, "soc")
}
```

### 3.4.4 Economic sub-criteria

Walk over all input CSV files, select necessary columns, filter cells by given algorithm, and write the results to output CSV files:

```
[19]: vec_colnames_search_1 <- c('AW01', 'AW02', 'AW03')
vec_colnames_search_2 <- c('RW01_01', 'RW02_01', 'RW03_01', 'RW04_01', 'RW05_01',
↪'RW06_01')
vec_colnames_out <- c('Qual_LVCs', 'Qual_Affo', 'LVCs_Affo')

for ( row_idx in 1:nrow(df_csvInputFiles) ) {
  # create list of dataframes from current input CSV file
  str_filename <- paste(str_input_path_prep, df_csvInputFiles[row_idx, filenames],
↪sep="/")
  list_dataframes <- func_readCSVdata_to_dataframes(str_filename)

  # scramble the dataframes
  df_scrambledData <- func_scrambleData(list_dataframes[[4]],
↪vec_colnames_search_1, vec_colnames_search_2, vec_colnames_out)

  # write scrambled dataframes to output CSV file
  func_writeDataframe_to_CSVfile(str_output_path_prep, df_csvInputFiles[row_idx,
↪filenames], df_scrambledData, "eco")
}
```

## 4 Application of the processed survey data in the analytical hierarchy process (AHP)

### 4.1 Set globally used input and output folders for processing AHP

```
[20]: str_input_path_ahp = "./output_data_manipulated"
      str_output_path_ahp = "./output_data_AHP"
```

### 4.2 Define functions for processing AHP

#### 4.2.1 Function to read in the processed survey data from CSV files to dataframes

Define a function for reading in a CSV file to a data frame.

```
[21]: func_readCSVdata_to_dataframe <- function(str_CSVfilename) {

      df_CSVdata <- fread(
        file = str_CSVfilename, encoding = "UTF-8",
        header = TRUE, sep = "\t", quote = "\""
      )

      return(df_CSVdata)
    }
```

#### 4.2.2 Function to generate a dataframe with *eigentrue values* (weights)

```
[22]: func_genEigentrue_to_dataframe <- function(df_surveyData, vec_attributes) {
      list_mat_judgement <- df_surveyData %>%
        ahp.mat(vec_attributes, negconvert = TRUE)

      df_eigentrue <- ahp.indpref(list_mat_judgement, vec_attributes, method = "eigen")

      return(df_eigentrue)
    }
```

#### 4.2.3 Function to generate an array with consistency ratios

```
[23]: func_genCR_to_arr <- function(df_surveyData, vec_attributes) {
