December 6, 2022; version 0.1 (pre-release)

This is a placeholder for the abstract that needs to be added later.

Contents

1 Introduction

Why we use a Jupyter notebook to to publish the R program examples:

Jupyter is a new **open source** alternative to the proprietary numerical software Mathematica from **Wolfram Research** that is well on the way to become a **standard for exchanging research results** (Somers 2018; Romer 2018).

Originally Jupyter was intended as an IDE for the programming languages **Julia** and **Python**. Besides that it is also possible to install other interpreter kernels, such as the **IRkernel** for R. This can be interesting if the IDE **RStudio Desktop** is not available on the target platform used. For example, it is very difficult to install RStudio on the ARM-based embedded computer **Raspberry Pi** due to many technical dependencies. In contrast, using the R kernel in JupyterLab on the Raspberry Pi works very well and performant.

2 Global settings and dependencies

2.1 Install missing packages if not present yet

Attention: For some R packages several dependencies have to be installed first with `apt install <package name>`.

Dependencies for package `ahpsurvey`:
- R package `randomNames` (it depends on R 4.0, refer to https://cran.r-project.org/web/packages/randomNames/index.html)

Drawback for **Raspbian buster**: the dependency `randomNames` is not available for R v3.5.2 as it depends on R (4.0). Upgrading R in Raspbian following the instruction on https://cran.rstudio.com/bin/linux/debian/#debian-buster-stable does not work so far …

```
[1]: # List of R packages that are used in this script
     list.of.packages <- c("data.table", "ggplot2", "tidyr", "dplyr", "magrittr",
      ↪"ahpsurvey")

     # Query the already installed packages and save the missing ones in a new list
     missing.packages <- list.of.packages[!(list.of.packages %in% installed.
      ↪packages()[,"Package"])]

     # Install missing packages
     if(length(missing.packages)) {
         install.packages(missing.packages)
     } else {
         print("All required packages are installed.")
     }
```

```
[1] "All required packages are installed."
```

2.2 Load package `data.table`

The package `data.table` is used to read and manipulate tables (`data.table` inherits from `data.frame`). Install and load it:

```
[2]: library(data.table)
```

2.3 Load package `ggplot2`

The package `ggplot2` is used to plot diagrams. Install and load it:

```
[3]: library(ggplot2)
```

2.4 Load package `tidyr`

The package `tidyr` is used to **reshape** the dataframes and provides functions like `gather()` or `spread()`. Some examples for the application can be found here: Reshaping Your Data with tidyrReshaping Your Data with tidyr.

Install and load it:

```
[4]: library(tidyr)
```

2.5 Load package `dplyr`

The package `dplyr` is necessary to manipulate dataframes using functions like `select()`, `mutate()` and `left_join()`. Install and load it:

Hint: Setting the parameter `warn.conflicts=FALSE` when calling the `library()` function silences annoying messages about masked functions.

```
[5]: library(dplyr, warn.conflicts=FALSE)
```

2.6 Use pipes for better coding

HINT: The pipe functionality is already available by loading the library `tidyr` - so you don't have to load it explicitly.

What pipes like `%>%` are and how to use them is described here: https://statistik-dresden.de/archives/15679.

Before using pipes in R, you have to install and load the package `magrittr`:

```
[6]: library(magrittr, warn.conflicts=FALSE)
```

2.7 Load package `ahpsurvey`

The package `ahpsurvey` contains all the necessary mathematical and statistical methods to run the analytical hierarchy process (AHP).

```
[7]: library(ahpsurvey)
```

3 Functions for processing AHP

3.1 Set globally used input and output folders

```
[8]: str_input_path = "./output_data_manipulated"
     str_output_path = "./output_data_AHP"
```

3.2 Function to read in the processed survey data from CSV files to dataframes

Define a function for reading in a CSV file to a date frame.

```
[9]: func_readCSVdata_to_dataframe <- function(str_CSVfilename) {

       df_CSVdata <- fread(
         file = str_CSVfilename, encoding = "UTF-8",
         header = TRUE, sep = "\t", quote = "\""
         )

       return(df_CSVdata)
     }
```

3.3 Function for generating a data frame with *eigentrue values* (weights)

```
[10]: func_genEigentrue_to_dataframe <- function(df_surveyData, vec_attributes) {
        list_mat_judgement <- df_surveyData %>%
          ahp.mat(vec_attributes, negconvert = TRUE)

        df_eigentrue <- ahp.indpref(list_mat_judgement, vec_attributes, method = "eigen")

        return(df_eigentrue)
      }
```

3.4 Function for generating an array with consistency ratios

```
[11]: func_genCR_to_arr <- function(df_surveyData, vec_attributes) {
        arr_cr <- df_surveyData %>%
          ahp.mat(vec_attributes, negconvert = TRUE) %>%
          ahp.cr(vec_attributes, ri=0.58)

        return(arr_cr)
      }
```

3.5 Function for generating a data frame with consistency ratios

```
[12]: func_genCR_to_dataframe <- function(df_surveyData, vec_attributes, arr_cr,␣
      ↪consistency_thres=0.1, str_CRlabel) {
        df_cr <- df_surveyData %>%
          ahp.mat(vec_attributes, negconvert = TRUE) %>%
          ahp.cr(vec_attributes, ri=0.58) %>%
          data.frame() %>%
          mutate(rowid = 1:length(arr_cr), arr_cr.dum = as.factor(ifelse(arr_cr <=␣
      ↪consistency_thres, 1, 0)))

          # rename column with consistency ratios
          colnames(df_cr)[1] <- str_CRlabel

        return(df_cr)
      }
```

3.6 Function for visualizing individual priorities and consistency ratios

```
[13]: func_visuPriosCRs <- function(df_surveyData, df_cr, arr_cr, consistency_thres=0.1,␣
      ↪vec_attributes, df_eigentrue, vec_labels, str_image_filename) {
        df_cr_sel <- df_cr %>%
          select(arr_cr.dum, rowid)

        plot <- df_surveyData %>%
          ahp.mat(atts = vec_attributes, negconvert = TRUE) %>%
          ahp.indpref(vec_attributes, method = "eigen") %>%
          mutate(rowid = 1:nrow(df_eigentrue)) %>%
          left_join(df_cr_sel, by = 'rowid') %>%
          gather(all_of(vec_attributes), key = "var", value = "pref") %>%
          ggplot(aes(x = var, y = pref)) +
          geom_violin(alpha = 0.6, width = 0.8, color = "transparent", fill = "gray") +
          geom_jitter(alpha = 0.6, height = 0, width = 0.1, aes(color = arr_cr.dum)) +
```

```
        geom_boxplot(alpha = 0, width = 0.3, color = "#808080") +
        scale_x_discrete("Attribute", label = vec_labels) +
        scale_y_continuous("Weight (dominant eigenvalue)",
                           labels = scales::percent,
                           breaks = c(seq(0,0.7,0.1))) +
        guides(color=guide_legend(title=NULL))+
        scale_color_discrete(breaks = c(0,1),
                             labels = c(paste("CR >", consistency_thres),
                                        paste("CR <", consistency_thres))) +
        labs(NULL, caption = paste("n =", nrow(df_surveyData), ",", "Mean CR =",
                                   round(mean(arr_cr),3))) +
        theme_minimal() +
        ggtitle("Violins displaying priorities and consistency ratios")

    # save generated ggplot graphic to a PNG image file
    ggsave(filename = str_image_filename, width = 7, height = 7, dpi = 300)

    print(plot)
}
```

3.7 Function for generating geometric mean values from individual judgement matrices

```
[14]:  func_aggpref_gmean <- function(df_surveyData, vec_attributes, arr_cr,␣
       ↪consistency_thres=0.1, str_CRlabel) {
         df_cr <- df_surveyData %>%
           ahp.mat(vec_attributes, negconvert = TRUE) %>%
           ahp.cr(vec_attributes, ri=0.58) %>%
           data.frame() %>%
           mutate(rowid = 1:length(arr_cr), arr_cr.dum = as.factor(ifelse(arr_cr <=␣
       ↪consistency_thres, 1, 0)))

         # rename column with consistency ratios
         colnames(df_cr)[1] <- str_CRlabel

         # combine data frame 'df_cr' with raw survey data ('df_surveyData')
         df_cr_wRaw <- cbind(df_cr, df_surveyData)

         # remove rows, where 'arr_cr.dum' == 0 (inconsistent data)
         df_cr_wRaw_cons <- df_cr_wRaw[df_cr_wRaw$arr_cr.dum != 0, ]

         # get individual judgement matrices from last 3 columns
         list_mat_judgement <- df_cr_wRaw_cons[tail(names(df_cr_wRaw_cons), 3)] %>%
           ahp.mat(vec_atts, negconvert = TRUE)

         # get geometric mean values from judgement matrices
         list_gmean_l <- ahp.aggpref(list_mat_judgement, vec_atts, method = "eigen",␣
       ↪aggmethod = "geometric")

         return(list_gmean_l)
       }
```

3.8 Function for normalizing the geometric mean values

```r
[15]: func_norm_gmean <- function(list_gmeans) {
        # normalization so that the sum of the geometric mean values is 1 (corresponds to⏎
        ↪100%)
        df_gmean_l <- data.frame(list_gmeans)
        # rename column with geometric mean values (raw)
        colnames(df_gmean_l)[1] <- "gmean.raw"

        gmean_sum <- 0
        for ( val in list_gmeans ) {
          gmean_sum <- gmean_sum + val
        }
        df_gmean_l["Sum", 1] <- gmean_sum

        for (idx in 1:length(list_gmeans)) {
          gmean_norm <- list_gmeans[[idx]] / gmean_sum
          df_gmean_l[idx, "gmean.norm"] <- gmean_norm
        }

        gmean_sum_norm <- 0
        # iterate over all rows except the last, because this is the sum itself
        for ( row in 1:(nrow(df_gmean_l)-1) ) {
          gmean_sum_norm <- gmean_sum_norm + df_gmean_l[row, 2]
        }
        df_gmean_l["Sum", 2] <- gmean_sum_norm

        return(df_gmean_l)
      }
```

3.9 Function to process the ahpsurvey and create violin plots

```r
[41]: func_Process_ahpsurvey <- function(df_csvInputFiles, str_participants_group,⏎
      ↪str_input_path, str_output_path, df_attributes_labels) {
          row_start = 1
          row_end = 3

          df_outputTable <- data.table()

          for ( file_idx in 1:nrow(df_csvInputFiles) ) {
              # create data frame from current input CSV file
              str_filename <- paste(str_input_path, df_csvInputFiles[file_idx,⏎
      ↪filenames], sep="/")
              df_processed_survey_data <- func_readCSVdata_to_dataframe(str_filename)

              # create vectors for attributes and labels from a subset of data frame⏎
      ↪'df_attributes_labels_XXX'
              vec_atts <- df_attributes_labels[c(row_start:row_end), attr]
              vec_labels <- df_attributes_labels[c(row_start:row_end), labels]
              # shift row interval for next iteration
              row_start = row_start + 3
              row_end = row_end + 3

              # generate data frame with eigentrue values (weights)
              df_eigentrue_weights <-⏎
      ↪func_genEigentrue_to_dataframe(df_processed_survey_data, vec_atts)
```

```r
        # generate an array with consistency ratios
        arr_CRs <- func_genCR_to_arr(df_processed_survey_data, vec_atts)

        # generate a extended data frame with consistency ratios
        consistency_thres = 0.1
        str_CRlabel <- paste("CR", df_csvInputFiles[file_idx, keys], sep="_")
        df_CRs <- func_genCR_to_dataframe(df_processed_survey_data, vec_atts,
    →arr_CRs, consistency_thres, str_CRlabel)

        str_image_filename <- paste("ahp_violin", str_participants_group,
    →df_csvInputFiles[file_idx, keys], sep="_")
        print(str_image_filename)
        str_image_filename <- paste(str_image_filename, ".png", sep="")
        str_image_filename <- paste(str_output_path, str_image_filename, sep="/")
        func_visuPriosCRs(df_processed_survey_data, df_CRs, arr_CRs,
    →consistency_thres, vec_atts, df_eigentrue_weights, vec_labels, str_image_filename)

        # combine data frames of eigentrue values (weights) with consistency ratios
        df_outputTable <- cbind(df_outputTable, df_eigentrue_weights)
        # add only specific columns of 'df_CRs' (omit column 'row_id')
        df_outputTable <- cbind(df_outputTable, df_CRs[c(1, 3)])
    }

    # extend file name by path
    str_CSVfilename_output <- paste("rdata", str_participants_group,
    →"eigentrue_CRs", sep="_")
    str_CSVfilename_output <- paste(str_CSVfilename_output, ".csv", sep="")
    str_CSVfilename_output <- paste(str_output_path, str_CSVfilename_output, sep="/
    →")

    # write data frame 'df_outputTable' to CSV file
    write.table(df_outputTable, file = str_CSVfilename_output,
                fileEncoding = "UTF-8", row.names = FALSE,
                col.names = TRUE, sep = "\t", quote = TRUE)
}
```

4 Create data frames (tables) handling the file names of processed survey data

4.1 File table for all participants

```r
[16]: df_csvInputFiles_all <- data.table(
    file_idx = 1:4,
    keys = c("env", "soc", "eco", "crit"),
    filenames = c("rdata_all_env_AHP_edible_Cities_2022-03-18_09-53.csv",
                  "rdata_all_soc_AHP_edible_Cities_2022-03-18_09-53.csv",
                  "rdata_all_eco_AHP_edible_Cities_2022-03-18_09-53.csv",
                  "rdata_all_crit_AHP_edible_Cities_2022-03-18_09-53.csv"),
    descriptions = c("environmental sub-criteria",
                     "social sub-criteria",
                     "economic sub-criteria",
                     "criteria (main criteria)")
)
```

4.2 File table for city administrations

```
[17]: df_csvInputFiles_CA <- data.table(
        file_idx = 1:4,
        keys = c("env", "soc", "eco", "crit"),
        filenames = c("rdata_CA_env_AHP_edible_Cities_2022-03-18_10-28.csv",
                      "rdata_CA_soc_AHP_edible_Cities_2022-03-18_10-28.csv",
                      "rdata_CA_eco_AHP_edible_Cities_2022-03-18_10-28.csv",
                      "rdata_CA_crit_AHP_edible_Cities_2022-03-18_10-28.csv"),
        descriptions = c("environmental sub-criteria",
                         "social sub-criteria",
                         "economic sub-criteria",
                         "criteria (main criteria)")
      )
```

4.3 File table for non-governmental organizations

```
[18]: df_csvInputFiles_NGO <- data.table(
        file_idx = 1:4,
        keys = c("env", "soc", "eco", "crit"),
        filenames = c("rdata_NGO_env_AHP_edible_Cities_2022-03-18_10-40.csv",
                      "rdata_NGO_soc_AHP_edible_Cities_2022-03-18_10-40.csv",
                      "rdata_NGO_eco_AHP_edible_Cities_2022-03-18_10-40.csv",
                      "rdata_NGO_crit_AHP_edible_Cities_2022-03-18_10-40.csv"),
        descriptions = c("environmental sub-criteria",
                         "social sub-criteria",
                         "economic sub-criteria",
                         "criteria (main criteria)")
      )
```

4.4 File table for practitioners and experts

```
[19]: df_csvInputFiles_PE <- data.table(
        file_idx = 1:4,
        keys = c("env", "soc", "eco", "crit"),
        filenames = c("rdata_PE_env_AHP_edible_Cities_2022-03-18_10-41.csv",
                      "rdata_PE_soc_AHP_edible_Cities_2022-03-18_10-41.csv",
                      "rdata_PE_eco_AHP_edible_Cities_2022-03-18_10-41.csv",
                      "rdata_PE_crit_AHP_edible_Cities_2022-03-18_10-41.csv"),
        descriptions = c("environmental sub-criteria",
                         "social sub-criteria",
                         "economic sub-criteria",
                         "criteria (main criteria)")
      )
```

5 Exploit datasets of own survey with package `ahpsurvey` for each group of participants

```
[29]: df_attributes_labels <- data.table(
        idx = 1:12,
        attr = c("Clim", "BDiv", "CiEc",
                 "KEdu", "Comm", "Part",
                 "Qual", "LVCs", "Affo",
```

```
            "Envi", "Soci", "Econ"),
  labels = c("Microclimate and Hydrology", "Biodiversity", "Circular economy",
            "Knowledge and Education", "Community Building", "Participation",
            "Food Quality and Safety", "Local Value Chains", "Food Affordability",
            "Environment", "Society", "Economy")
)
```

5.1 All participants

```
[33]: func_Process_ahpsurvey(df_csvInputFiles_all, "all", str_input_path,␣
       ↪str_output_path, df_attributes_labels)
```

```
[1] "ahp_violin_all_env"
[1] "ahp_violin_all_soc"
[1] "ahp_violin_all_eco"
```
